

(Technical rail diagnostics and monitoring on the basis of hardware and software devices of automated dispatching control system)

Technical rail diagnostics and monitoring on the basis of hardware and software of automated dispatching control system is represented by complex of hardware and software which do automated control over trains traffic, diagnostics of the joints and devices of railway automatics and telemechanics, monitoring of computer based and communication devices. When certified measure equipment is applied in Technical rail diagnostics and monitoring system, this will allow to automate /computerize process of technical maintenance of the devices.
